If you think that there is some new truth to be learned humanly, you will be disappointed because there is not a single new truth in the entire world. The truth revealed in this book is not my truth or my message, but the word of God which has been imparting itself to universal consciousness throughout all time. That word of God is already embodied in your consciousness, and this truth, which is already your consciousness, is now being unveiled to you within you. Unless God is my consciousness, there will be no truth expressing itself through, or as, me; and, moreover, unless God is your consciousness, you will not understand the truth that is being presented. Written by an expert in the game industry, Christer Ericson's new book is a comprehensive guide to the components of efficient real-time collision detection systems. The book provides the tools and know-how needed to implement industrial-strength collision detection for the highly detailed dynamic environments of applications such as 3D games, virtual reality applications, and physical simulators. Of the many topics covered, a key focus is on spatial and object partitioning through a wide variety of grids, trees, and sorting methods. The author also presents a large collection of intersection and distance tests for both simple and complex geometric shapes. Sections on vector and matrix algebra provide the background for advanced topics such as Voronoi regions, Minkowski sums, and linear and quadratic programming. Of utmost importance to programmers but rarely discussed in this much detail in other books are the chapters covering numerical and geometric robustness, both essential topics for collision detection systems. Also unique are the chapters discussing how graphics hardware can assist in collision detection computations and on advanced optimization for modern computer architectures. All in all, this comprehensive book will become the industry standard for years to come.
